摘要: This article reports that the regions of the Earth that have contributed least to **global warming**, most notably Africa, are the most vulnerable to its harmful effects. The article also explores the health dangers associated with climate change in cities and on coastal populations. Large cities experience "urban heat island effect," which can cause health problems. Coastal flooding as a result of storm surges will affect up to 200 million people by 2080. The highest risk coastlines are along the Pacific and Indian Oceans and in sub-Saharan Africa. The article also discusses the need of fast growing economies like **China** and India to develop sources of sustainable energy.

CLIMATE CHANGE AND DISEASE

SPECTRUM

The places that have contributed the least to **warming** the Earth are the most vulnerable to the death and disease higher temperatures can bring, according to a 16 November report in Nature. Health and climate scientists at the University of Wisconsin-Madison and the World Health Organization (WHO) have shown that the growing health impacts of climate change affect different regions in markedly different ways.

Africa has among the lowest per capita emissions of greenhouse gases, yet regions of the continent are at an increased risk for **warming**-related disease. Many of the most important diseases in poor countries, from malaria to diarrhea and malnutrition, are highly sensitive to climate," says coauthor Diarmid Campbell-Lendrum, a scientist at the WHO Department for Protection of the Human Environment. "The health sector is already struggling to control these diseases, and climate change threatens to undermine these efforts.

Large cities that experience the "urban heat island effect" are also susceptible to temperature-related health problems. Flooding as a result of coastal storm surges will affect the lives of up to 200 million people
